

Backend Framework

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

The backend uses FastAPI (Python) for the CueAI API service. REST endpoints handle auth, meetings, licensing, and live answer proxying. The Next.js web app also hosts Knowledge Base admin APIs for document upload, chunking, embeddings, and retrieval.

Data and Queues

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

Databases store workspace, meeting, and knowledge metadata. Redis and Celery support asynchronous jobs when configured. Caching reduces repeated retrieval latency. Testing covers chunking, extraction sanitization, and RAG fallback behavior.

Deployment

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

Deployment targets containerized API workers and a Node web service. What backend framework does the application use? FastAPI for the Python API layer, with Next.js route handlers for Knowledge Base RAG.
