

Authentication

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

Authentication is handled with JWT access tokens issued after successful login. OAuth 2.0 / OIDC is supported for enterprise SSO. Session management invalidates tokens on logout and password change. Multi-factor authentication can be required for Admin roles.

Authorization and RBAC

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

Authorization uses RBAC with Admin, Manager, and User roles. Workspace isolation ensures one workspace cannot retrieve another workspace's documents. Meeting documents are isolated by meeting_id. Vector search always filters by workspace_id at query time.

API Security Practices

DEVELOPMENT TEST KNOWLEDGE - CueAI RAG fixtures. Not real customer or company documentation.

How is authentication handled? Clients present a Bearer JWT. The API validates signature, expiry, and workspace membership before serving Knowledge Base content or Live Session answers.
